You Don't Know How I Feel: Insider-Outsider Perspective Gaps in Cyberbullying Risk Detection

- One's personal experience and perception of cyberbullying incident can influence the performance of risk detection algorithms

- Compared cyberbullying detection models based on two different ground truth annotation schemes

- Models trained on the victims' perspectives had a higher recall for positive cyberbullying detection

- The insider model catches implicit references of bullying such as "people will beat me down" or "tired of being picked on by others"
